hirapan

ABOUT COMPANY

Hirapan, working in the Ereğli district of Zonguldak as of 2012, is established for automatic production with a capacity of 120 employee in 6.500m² closed area.

It is a Fully Integrated Towel Radiator Company, and all stages of production, including the pipe profile production line, are carried out in its own facility.

With its professional staff and computer aided machines, Hirapan has the ability to produce special products and designs models in the fastest way without compromising on quality.

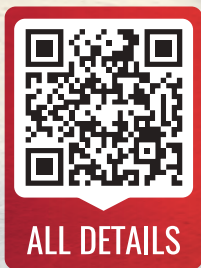

Meanwhile; In early 2022 Hirapan started to produce new technology panel radiators compatible with electrical and central heating systems in its second factory which has 7000m² closed area. We are proudly launching an alternative product against increasing energy costs with this product whose R&D belongs to ourselves.

With its automatic lines and experienced workforce, its annual production capacity is 500,000 towel warmers. Adopting the principle of "Full Quality", Hirapan controls every stage of production and every product produced is put to a leakproofness test. The paint shop and chrome plating units within the facility are operated by using eco-friendly products that are sensitive to environmental laws. It is growing rapidly in the sector with its domestic and international partners, which it sees as solution partners. Continuing its investments with the importance it attaches to R&D studies, Hirapan has started working to increase its production area to 20.000 m² closed area.

In addition, the importance of renewable energy sources has increased due to the increasing energy demand and the increase in the amount of carbon released to the nature during the use of energy produced with phosside fuels. Herein, Hirapan produces almost all of its energy needs by integrating the solar power plant, one of the renewable energy sources, into its facilities, and becomes an exemplary company in the sector by following a ecofriendly policy with minimum carbon emissions.
